

Global Environment Policy

August 2019

For the past 12 years, GreenYellow has been performing as a major player in the energy transition in 8 countries across the globe. We have been an accelerator of our clients' energy transition using a platform of technical solutions to enable them to consume better and consume less, while reducing their energy bills or their ecological footprint.

At GreenYellow, we place our customers' satisfaction at the core of our strategy and operations, guiding us to achieve high quality, sustainable projects and to contribute to our environment respect and preservation.

As a consequence, and alongside the quality management processes launched in our main locations, GreenYellow has engaged in a global environment campaign encompassing market trends, clients' expectations and local particularities, and has defined 4 key commitments aspiring:

- 1/ To foster and encourage environmental consciousness in our offices as well as in the public area**
- 2/ To support climate change mitigation and adaptation with our technologies and expertise**
- 3/ To save, recycle and preserve natural resources and biodiversity by adapting our practices to environmental issues**
- 4/ To be part of a continuous improvement process that takes into account the needs and expectations of stakeholders**

Each of these commitments is embodied by a variety of tangible initiatives, defined either at a global scale or by our local offices. Each initiative has a set target for the year to come and is being monitored throughout the year to measure its progress and steer the efforts when necessary.

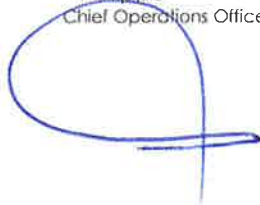

Furthermore, our General Management team is fully involved to ensure that the necessary resources are made available, as well as to mobilize all actors and all relevant stakeholders in this approach.

At GreenYellow, we fundamentally believe that the sustainability of our businesses and our long-term clients' satisfaction are closely intertwined with our company's skills and values, and our ability to achieve a positive environmental impact throughout the development of our activities.
